7. Rivalo: Posição 6, com uma pontuação de 4,0(43.437), o app de apostas esportivas Rivalo é um dos principais sites disponí

Written by Yale University's Diana Chigbu (Ph.D.) Obesity in

the United States is a pressing public health concern: More than 65 percent of adult Americans are overweight or obese, and nearly three out of every four children born between 2010 and 2014 were either overweight or obese at birth (CDC 2024). The United States spends R\$320 billion annually to treat the consequences of childhood obesity alone, including type II diabetes and cardiovascular disease. Childhood obesity is also linked with lower academic achievement in children as well as adults (Sobal et al., 2024). Obese women have a higher chance of having babies born prematurely or too large to be delivered vaginally; they are more likely to develop gestational diabetes and preeclampsia, which can negatively affect the health of their unborn children (CDC 2024). In the United States, approximately 45 percent of non-Hispanic Black women give birth before completing at least one year in utero compared to only 16.3 percent of white mothers; over half of these preterm births are considered medically high risk (CDC 2024). A woman's race is a significant factor affecting her likelihood of becoming obese before, during and after pregnancy (Sobal et al., 2024). According to the World Health Organization, Black women in America have one of the highest rates of overweight/obesity at 49.5 percent compared with white women's rate of 38.1 percent; Hispanic women are similarly affected (WHO 2024). Race and socioeconomic status also play a role in how obese a woman is before, during and after pregnancy. Women who live in poverty have an increased likelihood of being obese than those with higher household income; however, the relationship between race/ethnicity and socioeconomic position varies by type of employment: While Black women are disproportionately represented among low-wage workers (WHO 2024), they are less likely to be working as a service industry employee than Latinas. A woman's diet prior to conception is essential for her own health and the baby's, especially if she plans to become pregnant in the future. But access to fresh fruits and vegetables varies by race (Fallin et al., 2024). For example, Latinas are more likely than white women to live in neighborhoods without a grocery store selling healthy food options; they also tend to eat fewer servings of fruit each day compared with their Black and white counterparts (Sobal et al., 2024). Without access or knowledge about what is considered healthy, women who are obese have less nutritious diets before conception, during pregnancy and after giving birth. This can result in more severe weight gain than normal; a woman with an average BMI of +3 (the difference between being overweight and underweight) at the beginning of her first trimester is five times as likely to become obese by the end of that same pregnancy compared with women who began their pregnancies with an average BMI (+1) or a normal weight (-1), according to research from the Harvard T.H. Chan School of Public Health (2024). Race and ethnicity also play a role in how many calories a woman should eat daily during pregnancy and after giving birth, as well as what constitutes healthy levels for gestational diabetes or blood pressure. For example: According to the World Health Organization (2024), Black women are more likely than white women to have elevated glucose levels that indicate a risk of gestational diabetes; Hispanic and Asian mothers face similar risks. Women with high blood pressure during pregnancy, also known as hypertensive disorders of pregnancy (HDP), can develop long-term conditions for themselves or their child such as heart disease, stroke and retinopathy. Black women are 30 percent more likely than white women to have HDP during pregnancy; the percentage increases with increasing maternal age (CDC 2024). The health of an expectant mother is important not only for her child's development but also for his or her own well-being. However, access to prenatal care and nutritious food can vary by race; Black women are more likely than white women to be uninsured (CDC 2024). And, while Black women may have higher rates of HDP during pregnancy compared with their white counterparts, they're less likely to receive medication for that condition if it is diagnosed. A study by the American Journal of

Obstetrics and Gynecology shows that uninsured or underinsured black women were more than twice as likely not to be prescribed metformin treatment compared with their white counterparts (2024). It's also important for a woman who is obese before conception, during her pregnancy and after giving birth to know what level of weight she should aim to reach by the end. Obesity increases the risk of health problems including diabetes, heart disease and even certain types of cancer (CDC 2024); however, a woman's target for postpartum recovery also varies depending on her race or ethnicity. For example: A Black woman with gestational diabetes is more likely than an Asian American to gain more weight during pregnancy and less likely to regain their normal body weight after delivery (CDC 2024). Although healthcare professionals can help women who are obese understand what they should eat before conception, in the womb or following childbirth, some may lack resources that could assist them. If a woman is uninsured or underinsured and/or her provider doesn't have experience treating patients with severe obesity (as defined by BMI of 40), she might be referred to an out-of-network facility, creating additional barriers in accessing care. Fortunately, there are programs that help women who may lack access or knowledge about proper nutrition and weight management before conception, during pregnancy and after giving birth. For example: The Healthy Start Initiative (HSI) is a community-based organization working to reduce the infant mortality rate in Black communities in Florida by educating families on healthy child development practices. HSI provides education about breastfeeding, nutrition during pregnancy and after delivery through home visits; they also provide information for parents of newborns regarding immunizations and well-child care (Couser et al., 2024). In order to achieve the best possible outcome for both mother and child, healthcare professionals must be aware of women's risk factors for obesity before they become pregnant; throughout their time with their baby in utero as well as after giving birth. Race is just one factor that can influence a woman's access to proper care during these critical times – but it shouldn't determine whether she receives the help she needs to start her family on the right path for life.

## **Resposta da plataforma:**

### **Plataforma de resposta: baixar aplicativo de aposta esportiva**

When it comes to women's health, specifically regarding obesity and childbirth, access to proper care can be influenced by various factors. For instance, if a woman is uninsured or underinsured, her options for seeking appropriate treatment may be limited, which could impact both maternal and infant health outcomes.

However, there are programs designed specifically to address the unique challenges faced by pregnant women, especially those who lack resources and information about proper nutrition and weight management before conception, during pregnancy, and after childbirth. The Healthy Start Initiative (HSI) is one such program, a Florida-based organization working to reduce infant mortality rates in Black communities by educating families on healthy practices related to breastfeeding, nutrition, immunizations, and well-child care through home visits.

Healthcare professionals play an essential role in identifying women's risk factors for obesity before pregnancy as well as during their time with the baby while it is still developing inside or after birth. It's crucial to ensure that healthcare providers are aware of these risk factors and actively work towards addressing them so women can receive the necessary support they need throughout their journey, regardless of racial background or other potential barriers.
