---

To use the top down betting astrategy, you first need to determine The Desired payout. This will be in amount You want to win; and it should be based on the Amount of money You are Willing from risk! Once that have determined The PayOut: I can rework backwards for calculate an outcome.

For example, let's say you want to win R\$100 using the top down betting strategy: You have a bankroll of \$500; and you are willing to risk 10% of it in Bankroll on Each individual wager! To calculate the amount that need for each bet on the first Wager", I can Use an following formula:"

$$\text{Bet} = (\text{Payout} / (\text{Odds} - 1)) * (1 + (2 / \text{Desired PayOut}))$$

In this formula, "Payout" is the amount you want to win. ("Odds") Is The Decimal odds of the bet; and "Desired PayOut", is The ratio of it pay in To an initial stake! For example: -if on odds from me dice are 2.5 And you want for comon R\$100, by formula would be:"

$$\text{Bet} = (\$100 / (2.5 - 1)) * (1 + (2 / 100, R\$10" já).$$
